

Programing Languages Used in Ai

- **Java:**

It is one of the most commonly used languages in Ai that came into existence way before Python. It is still ranked among five top languages for AI programming. It has complex syntax than Python, but the speed of execution is quite higher.

- **C++:**

If you use some library for AI and machine learning, chances are good that this library was written in C or C++ and that you use this library from some other language, like Python.

Even if the program is written in Python, lower level libraries are very likely to be compiled and written in C++.

You can design and build fast and efficiently using the libraries from inside Python. But those libraries was made using C++.

C++ is most suited for interfacing with and controlling GPUs or Writing low level libraries.
