

Github and Git

- Git is a version control system to handle projects and create branches to work on multiple versions of same project and it does all of this on the local machine
- Github is the same as Git but it's a cloud version that can make people collaborate with each other on the same project
- Git commands:
 - git init : initializing a repository
 - git add: add file on stage
 - git commit: save changes on file
 - git push/pull: save changes on remote repos like in github
 - git clone: copy a repo
